Error Analysis:

ERROR_SUMMARY: The error occurs because the test DataFrame passed to `predictor.predict_proba()` only contains the columns `['image_name', 'image']`, while the model was trained using additional tabular metadata columns: `['skin_tone', 'alternative_skin_tone', 'expert_opinion', 'skin_tone', 'image', 'label', 'image_name']`. AutoGluon MultiModal requires all non-label columns used during training (except the label itself) to be present at prediction time, so it raises a ValueError when the test set is missing `['alternative_skin_tone', 'expert_opinion', 'skin_tone']`.

SUGGESTED_FIX:
Modify your test DataFrame before prediction to include the missing columns (`'skin_tone'`, `'alternative_skin_tone'`, `'expert_opinion'`). Add these columns to the test DataFrame with placeholder values (e.g., `np.nan` or a default value), ensuring the column names and order match those used in training. This will allow AutoGluon to process the test data without error, even if the metadata is unavailable at inference time.

Error Analysis:

ERROR_SUMMARY: The error occurs because the symbol `TabularBlock` is used in the `build_dataloaders` and `build_test_dl` functions, but it is not imported or defined anywhere in the script. This results in a `NameError` at runtime, preventing the construction of the fastai `DataBlock` for combining image and tabular data.

SUGGESTED_FIX:

Add `from fastai.tabular.all import TabularBlock` to the import section near the top of your script, ensuring that `TabularBlock` is available in the namespace before it is used in the `DataBlock` definitions. After adding this import, rerun your script to verify that the error is resolved.

+ hyperopt==0.... [truncated, 42057 chars total]

Error Analysis:

ERROR_SUMMARY: AutoGluon Tabular failed to train any models because the Ray backend attempted to create UNIX domain sockets with file paths exceeding the system limit of 107 bytes ("AF_UNIX path length cannot exceed 107 bytes"). This is due to excessively long temporary directory paths (e.g., /sc-scratch/sc-scratch-ikim-guidlight/tmp/ray/session_.../sockets/plasma_store), causing OSError during model training and resulting in no models being fit.

SUGGESTED_FIX:
Shorten the base directory path used for temporary files and model outputs to ensure all UNIX socket paths remain under 107 bytes. Move your working directory (including data, output, and conda environment) to a location with a much shorter absolute path (e.g., /tmp/mlzero or /scratch/mlzero), and update all relevant path variables in your scripts and environment setup accordingly. Then, rerun the pipeline to allow Ray and AutoGluon to create sockets within the allowed path length.

... [truncated, 18444 chars total]

Error Analysis:

ERROR_SUMMARY: The error occurs during model training with AutoGluon MultiModal using a Swin Transformer backbone and torch.compile (PyTorch 2.x). The root cause is an incompatibility between torch.compile (with CUDA graphs enabled) and the Swin Transformer model, leading to a RuntimeError: "accessing tensor output of CUDAGraphs that has been overwritten by a subsequent run." This is likely due to in-place tensor modifications or lack of proper tensor cloning in the model or data pipeline, which torch.compile with CUDA graphs cannot safely handle.

SUGGESTED_FIX:
Disable torch.compile by setting `"env.compile.turn_on": False` in your hyperparameters when calling `predictor.fit()`. This will avoid the use of CUDA graphs and prevent the tensor overwrite error. If you require compilation for speed, consider using a different backbone (e.g., ResNet) or wait for upstream fixes in PyTorch/AutoGluon that improve compatibility with Swin Transformer and torch.compile.

Error Analysis:

ERROR_SUMMARY: The script raises a NameError because it attempts to call a function named main() at the end, but no such function is defined anywhere in the code. As a result, the script does not execute any training, prediction, or output logic.

SUGGESTED_FIX: Define a main() function that encapsulates the intended workflow (data loading, preprocessing, model training, prediction, and output saving), or move the relevant code directly under the if __name__ == "__main__": block. Ensure that main() is properly implemented and invoked so the script executes as intended.
