Error Analysis:

ERROR_SUMMARY: The error occurs because the string value provided to the `presets` argument in `MultiModalPredictor.fit()` ("medium_quality_faster_train") is not recognized by the installed version of AutoGluon MultiModal. The function expects a valid preset name, but "medium_quality_faster_train" is not among the supported options, resulting in a `ValueError: Unknown preset type: medium_quality_faster_train`.

SUGGESTED_FIX:
Remove the `presets="medium_quality_faster_train"` argument from your `predictor.fit()` call, or replace it with a valid preset supported by your AutoGluon version (such as `"best_quality"`, `"high_quality"`, `"medium_quality"`, or `"fast_train"`). If you want to control training speed and quality, do so by adjusting the `hyperparameters` dictionary directly instead of using an unsupported preset string.

+ hyperopt==0.... [truncated, 42224 chars total]

Error Analysis:

ERROR_SUMMARY: AutoGluon failed to train any models because the Ray backend (used for parallel model training) attempted to create UNIX domain sockets with file paths exceeding the system limit of 107 bytes. This resulted in repeated OSError exceptions (`validate_socket_filename failed: AF_UNIX path length cannot exceed 107 bytes`), causing all model training attempts to be skipped and ultimately raising a RuntimeError due to no models being fit.

SUGGESTED_FIX:
Shorten the directory paths used for temporary files and model checkpoints by moving your working/output directories to a location with a much shorter absolute path (e.g., `/tmp/ag_run` or `/scratch/ag_run`). Set the `output` and `MODEL_SAVE_DIR` variables accordingly before running AutoGluon. This will ensure that all UNIX socket paths generated by Ray remain under the 107-character limit and prevent the OSError.
