... [truncated, 19941 chars total]

Error Analysis:

ERROR_SUMMARY: The error occurs because the test DataFrame provided to ``predictor.predict_proba()`` is missing required columns (``alternative_skin_tone`` and ``expert_opinion``) that were present in the training data. AutoGluon MultiModalPredictor expects the test data to have the same set of columns as the training data (except for the label), and will raise a ValueError if any are missing.

SUGGESTED_FIX:

Modify the test DataFrame before prediction to include all columns used during training (``image``, ``skin_tone``, ``alternative_skin_tone``, ``expert_opinion``). For columns not available in the test set, add them with placeholder values (e.g., ``np.nan`` or a default value), ensuring the column names and order match the training data schema. This will allow AutoGluon to process the test data without raising a missing columns error.

Error Analysis:

ERROR_SUMMARY: The script failed with a ValueError because the .fit() method of AutoGluon TabularPredictor does not accept a seed argument. The random seed for reproducibility should be set in the TabularPredictor constructor, not in the .fit() call.

SUGGESTED_FIX: Remove seed=SEED from the .fit() method call and instead pass seed=SEED as a parameter when constructing the TabularPredictor object. Ensure that all other .fit() arguments are valid according to the AutoGluon documentation.
