Error Analysis:

ERROR_SUMMARY: The error occurs because the test dataframe passed to ``predictor.predict_proba()`` is missing required columns (``alternative_skin_tone``, ``expert_opinion``, ``skin_tone``) that were present during training. AutoGluon MultiModal requires all non-label columns used in training to also be present (with the same names) in the test data, even if their values are missing or unknown.

SUGGESTED_FIX:

Before calling ``predictor.predict_proba()``, ensure the test dataframe includes all columns used during training (``image``, ``alternative_skin_tone``, ``expert_opinion``, ``skin_tone``, and any others except the label). For columns not available in the test set, add them with placeholder values (e.g., ``np.nan`` or a default value) so that the test dataframe schema matches the training dataframe. This will allow AutoGluon to process the test data without raising a `ValueError`.

+ hyperopt==0.... [truncated, 41795 chars total]

Error Analysis:

ERROR_SUMMARY: AutoGluon failed to train any models because the Ray backend (used for parallel model training) attempted to create UNIX domain sockets with file paths exceeding the system limit of 107 bytes (`AF\_UNIX path length cannot exceed 107 bytes`). This resulted in repeated `OSError` exceptions during model training, causing all models to fail and ultimately raising a `RuntimeError: No models were trained successfully during fit()`.

SUGGESTED_FIX:

Shorten the directory paths used for temporary files and model output—specifically, move your working, scratch, and output directories to locations with much shorter absolute paths (e.g., `/tmp/agrun` or `/scratch/agrun`). Ensure that the total path length for any Ray session or socket file will not exceed 107 bytes. You may also set the `RAY\_TMPDIR` environment variable to a short path before running your script to force Ray to use a shorter base directory for its temporary files. After making these changes, rerun your training script.
