Error Analysis:

ERROR_SUMMARY: The error occurs because the target column ('label') in your training dataframe contains NaN values after preprocessing. This is likely due to some label values in train.csv not matching the keys in your label mapping dictionary, causing the mapping to produce NaN for those rows.

SUGGESTED_FIX: Inspect the unique values in the 'label' column of train.csv and ensure your label mapping dictionary covers all possible label strings present. Update the mapping or add a check to raise an error if unmapped labels are found, and verify that no NaNs remain in the 'label' column before proceeding to train_test_split.

Error Analysis:

ERROR_SUMMARY: The error occurs because the label mapping in the code only accounts for 'malignant' and 'non-neoplastic', but the training data contains an additional label value: 'benign'. As a result, the function `check\_label\_coverage` raises a ValueError when it encounters 'benign' as an unmapped label in the training data.

SUGGESTED_FIX:

Inspect the unique values in the 'label' column of your training data and update the label mapping in `get\_label\_map()` to include all relevant classes (e.g., map both 'benign' and 'non-neoplastic' to 0 if they are both considered non-malignant). Ensure that the mapping reflects the intended binary classification (malignant vs. benign/non-malignant) and that all label values in the dataset are covered by the mapping.

Error Analysis:

ERROR_SUMMARY: The error occurs because the code attempts to import ``Image2Vec`` from the ``FlagEmbedding`` package, but this symbol does not exist in the installed version of the package. This is likely due to a version mismatch, a change in the `FlagEmbedding` API, or an incorrect/incomplete installation of the package.

SUGGESTED_FIX: Check the installed version of the `FlagEmbedding` package and consult its official documentation or PyPI page to verify the correct import path and available classes. If ``Image2Vec`` is not present, update your code to use the correct class or function for image embedding (such as ``FlagImageEncoder`` or similar), or install a version of `FlagEmbedding` that provides ``Image2Vec`` if required.

Error Analysis:

ERROR_SUMMARY: The error occurs because the `MultiModalPredictor` constructor in the installed version of AutoGluon (1.5.1b20260508) does not accept a `seed` keyword argument. Passing `seed=SEED` to the constructor results in a `TypeError`, preventing model instantiation and script execution.

SUGGESTED_FIX: Remove the `seed=SEED` argument from the `MultiModalPredictor` constructor call. If reproducibility is required, set the random seed using other means (e.g., global random/NumPy seeds or via the `fit()` method if supported), but do not pass `seed` to the constructor.

Error Analysis:

ERROR_SUMMARY: The code executed successfully and produced output, but the reported validation AUROC is 1.00000, which is unrealistically perfect and indicates severe data leakage between the training and validation sets. This suggests that information from the validation set is inadvertently being used during training, invalidating the evaluation and model performance.

SUGGESTED_FIX: Carefully review the data preprocessing and splitting logic to ensure that the validation set is completely isolated from the training process. Check for any accidental reuse of image features, metadata, or labels between train and validation splits, and verify that no information from the validation set is accessible to the model during training or feature extraction.

Error Analysis:

ERROR_SUMMARY: The validation AUROC is exactly 1.0, which is unrealistically perfect and indicates severe data leakage between the training and validation sets. This suggests that information from the validation set is being used during training or feature extraction, likely due to improper separation of data during preprocessing or feature extraction steps.

SUGGESTED_FIX: Carefully review your data splitting and feature extraction pipeline to ensure that the validation set is completely isolated from the training process. Specifically, make sure that any feature extraction (especially using pretrained models) is performed separately for the training and validation sets, and that no normalization, augmentation, or metadata derived from the full dataset is shared between them. Double-check that the validation images and their features are not included in any form in the training data or model fitting steps.

Error Analysis:

ERROR_SUMMARY: The script completed without runtime errors and produced output, but the reported validation AUROC is 1.00000, which is implausibly perfect and strongly indicates data leakage or an invalid validation split. This means the model likely had access to information from the validation set during training, making the evaluation unreliable. Additionally, the script does not measure or minimize the AUROC gap between light and dark skin tones, which is a required fairness criterion for this task.

SUGGESTED_FIX:

Carefully review the data preprocessing and splitting steps to ensure that no information from the validation set is used during training or feature extraction (including image feature extraction and metadata). Double-check that feature extraction is performed strictly within each split, and that no data from the validation set leaks into the training process. Furthermore, implement code to compute AUROC separately for light and dark skin tone groups and report (and aim to minimize) the AUROC gap between them, as required by the task.
